

# Distributed Systems

a.y. 2023/2024

---

# Distributed Systems:

Naming

---

- 
- Names:
    - Resource sharing
    - Unique resource identification
    - Reference of locations
  - Name resolution
  - Naming systems (distributed across...)
  - Efficiency and scalability issues
-

---

# A name is ...

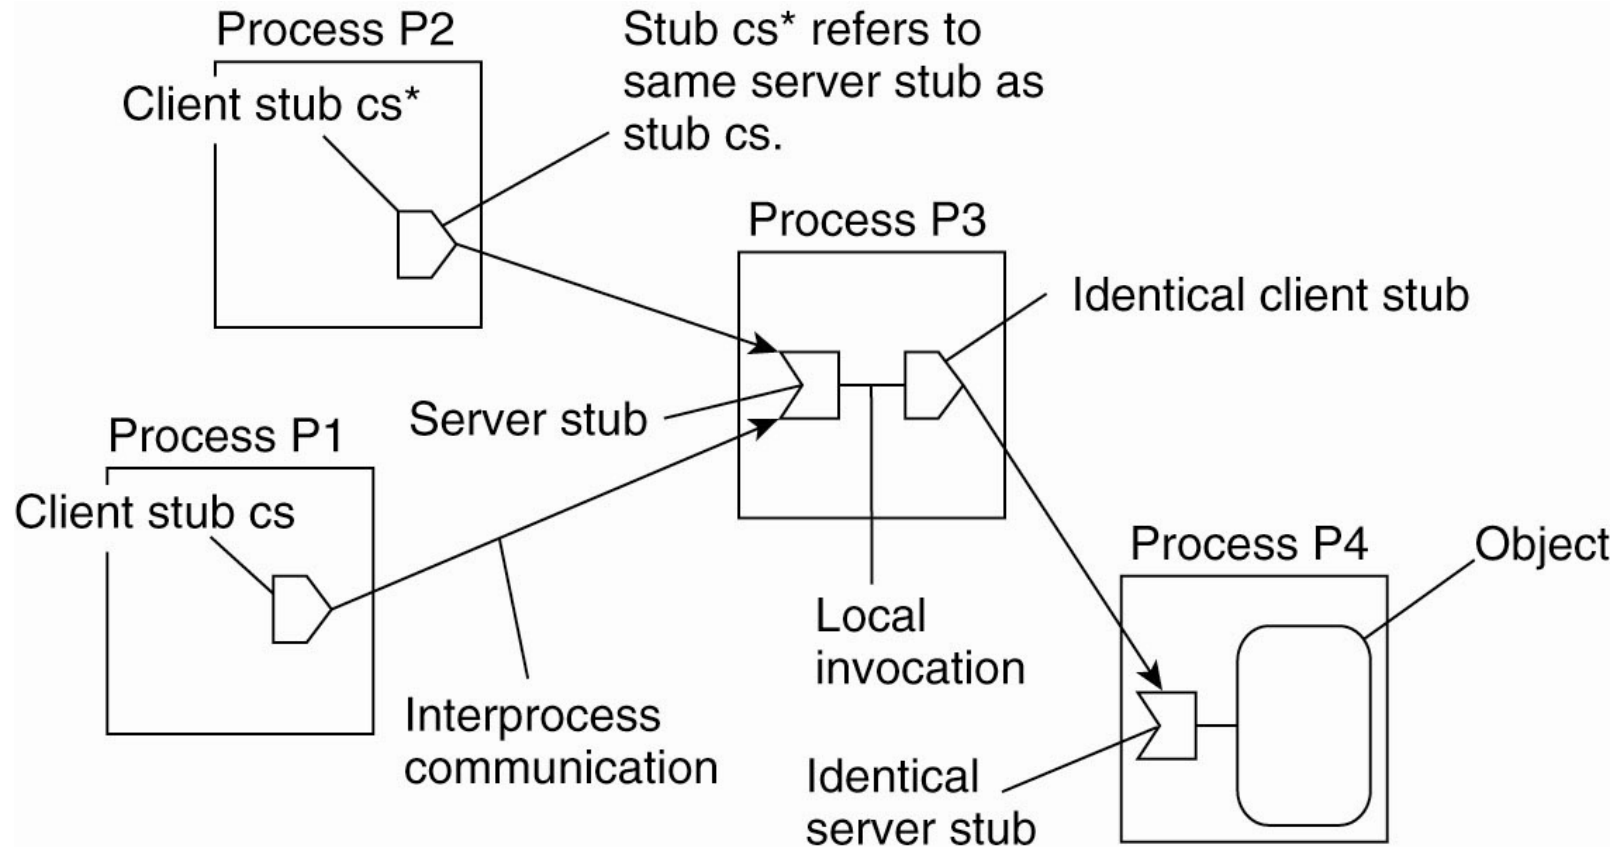

- ...string of bit (characters) to refer to an entity
  - To operate on an entity...access point
  - The name of an access point is called address
  - Can the name of the access point of an entity be the name of the entity ?
  - Location independent names
-

---

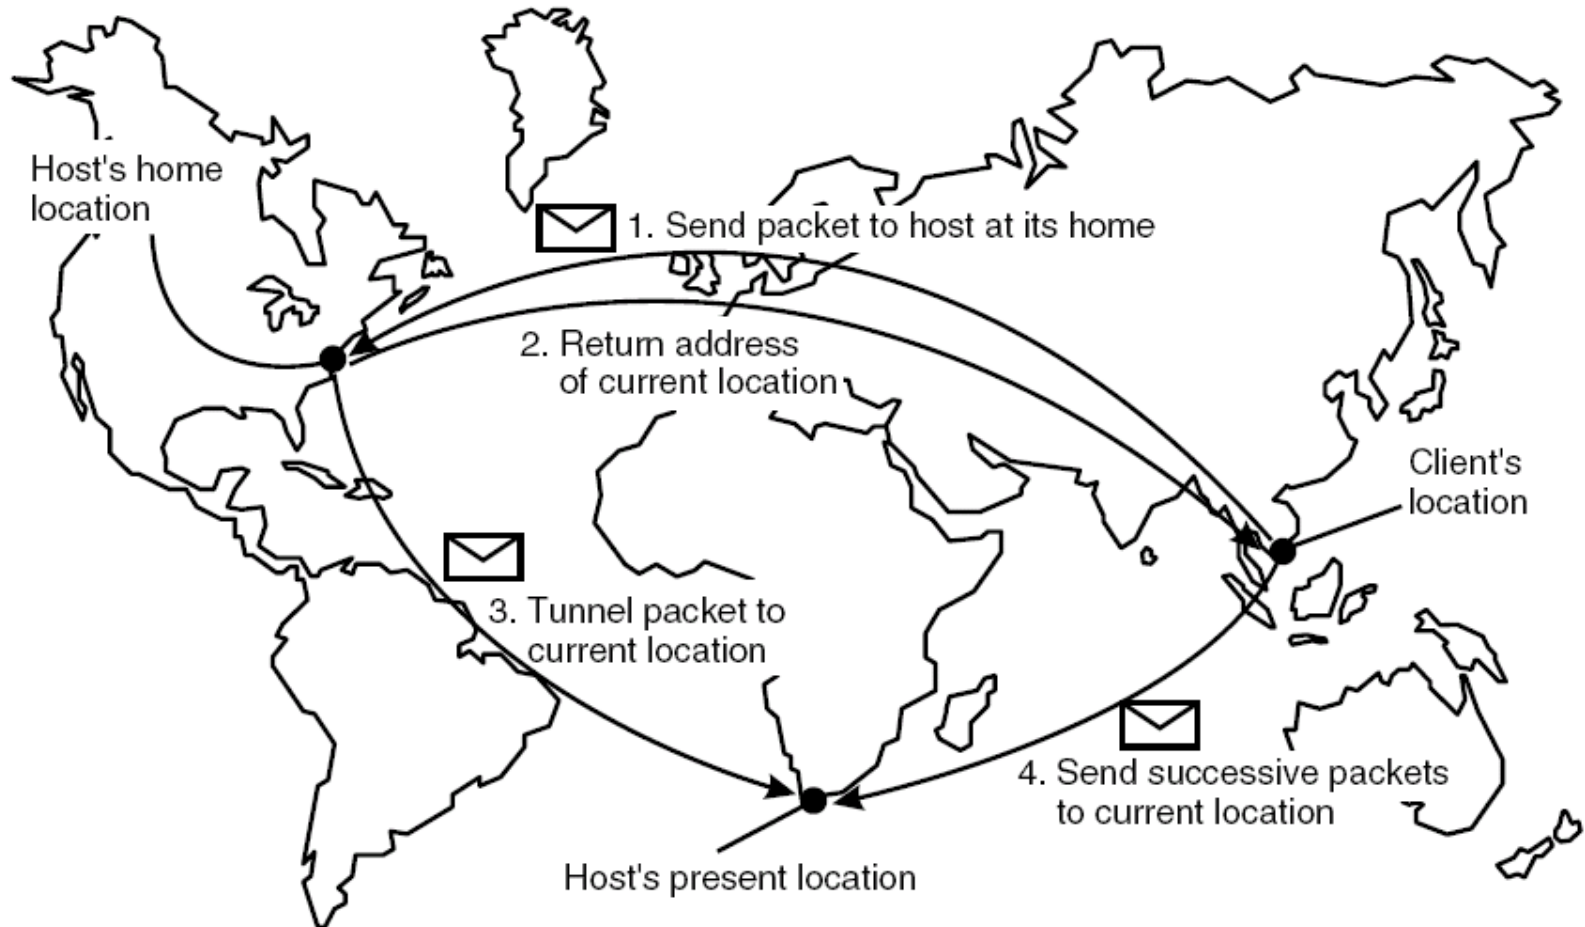

## A true identifiers

- An identifier refers to at most one entity.
  - Each entity is referred to by at most one identifier.
  - An identifier always refers to the same entity
-

# Forwarding Pointers using (client stub, server stub) pairs

# Home-Based Approaches

---

# Names to address binding

- Human-friendly names
  - A (name,address) table over the network...
  - Solving names is related to message routing
-

# Distributed Hash Tables

## General Mechanism

- 
- Resolve a key  $k$  to the address of  $\text{succ}(k)$
  - A linear approach:
    - $p$
    - $\text{succ}(p+1)$
    - $\text{prec}(p)$
-

- 
- Each node maintains a table with  $m$  entries
  - $FT_p[i] = \text{succ}(p + 2^{i-1})$
  - $q = FT_p[i] < k < FT_p[i+1]$
-

# Distributed Hash Tables

## General Mechanism

# Distributed Hash Tables

## General Mechanism

- Resolving key 26 from node 1 and key 12 from node 28

- 
- Entering the ring....
    - Lookup for  $\text{succ}(p+1)$
  - Leaving the ring...
-

---

- Keeping the table up-to-date

- $q = \text{pred}(\text{succ}(q+1)) \dots$  For  $\text{FT}_q[1]$

- $k = q + 2^{i+1}$  for each entry  $\dots$

---

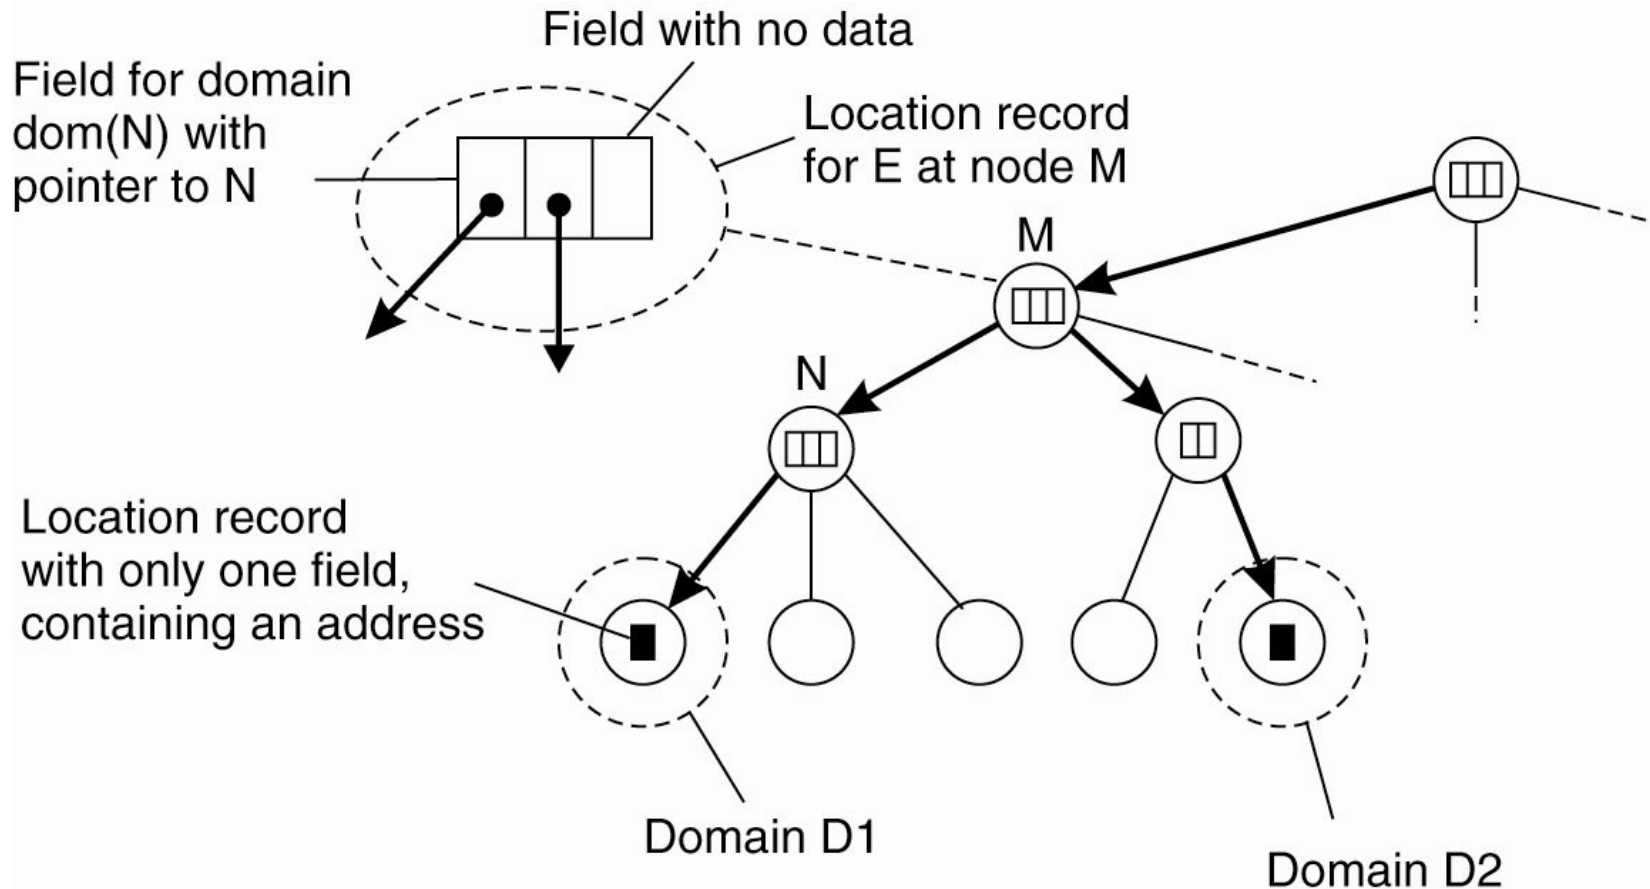

# Hierarchical Approaches

- Hierarchical organization of a location service into domains, each having an associated directory node.

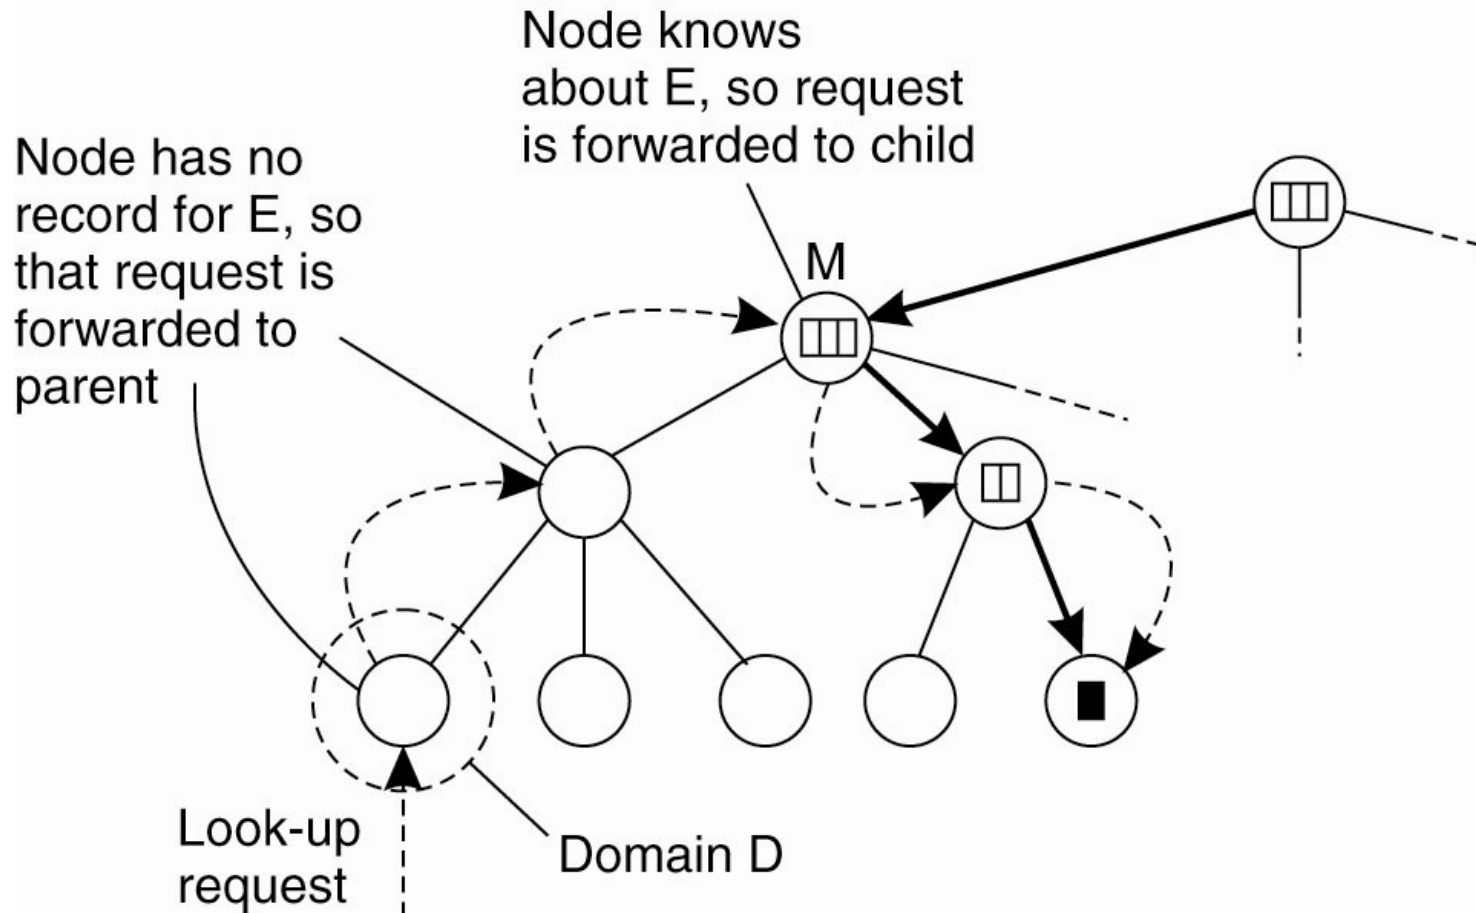

# Hierarchical Approaches

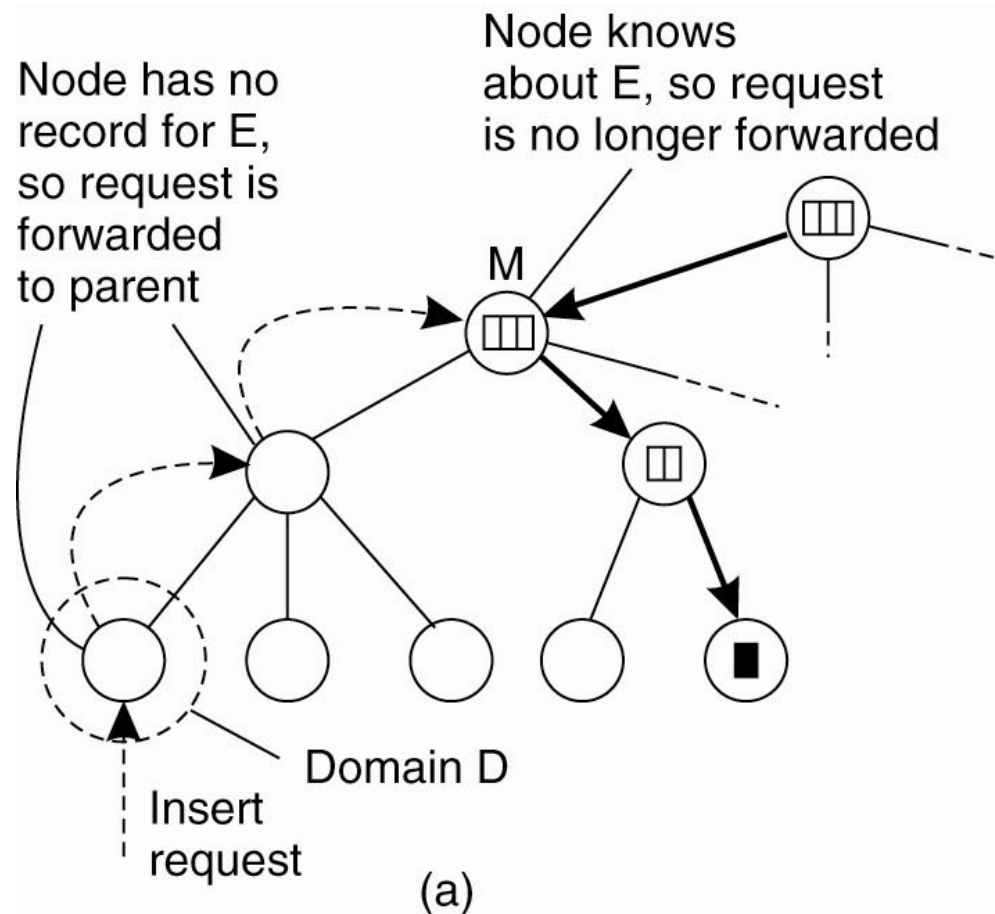

- Storing information of an entity having two addresses in different leaf domains.

# Hierarchical Approaches

- Looking up a location in a hierarchically organized location service.

# Hierarchical Approaches

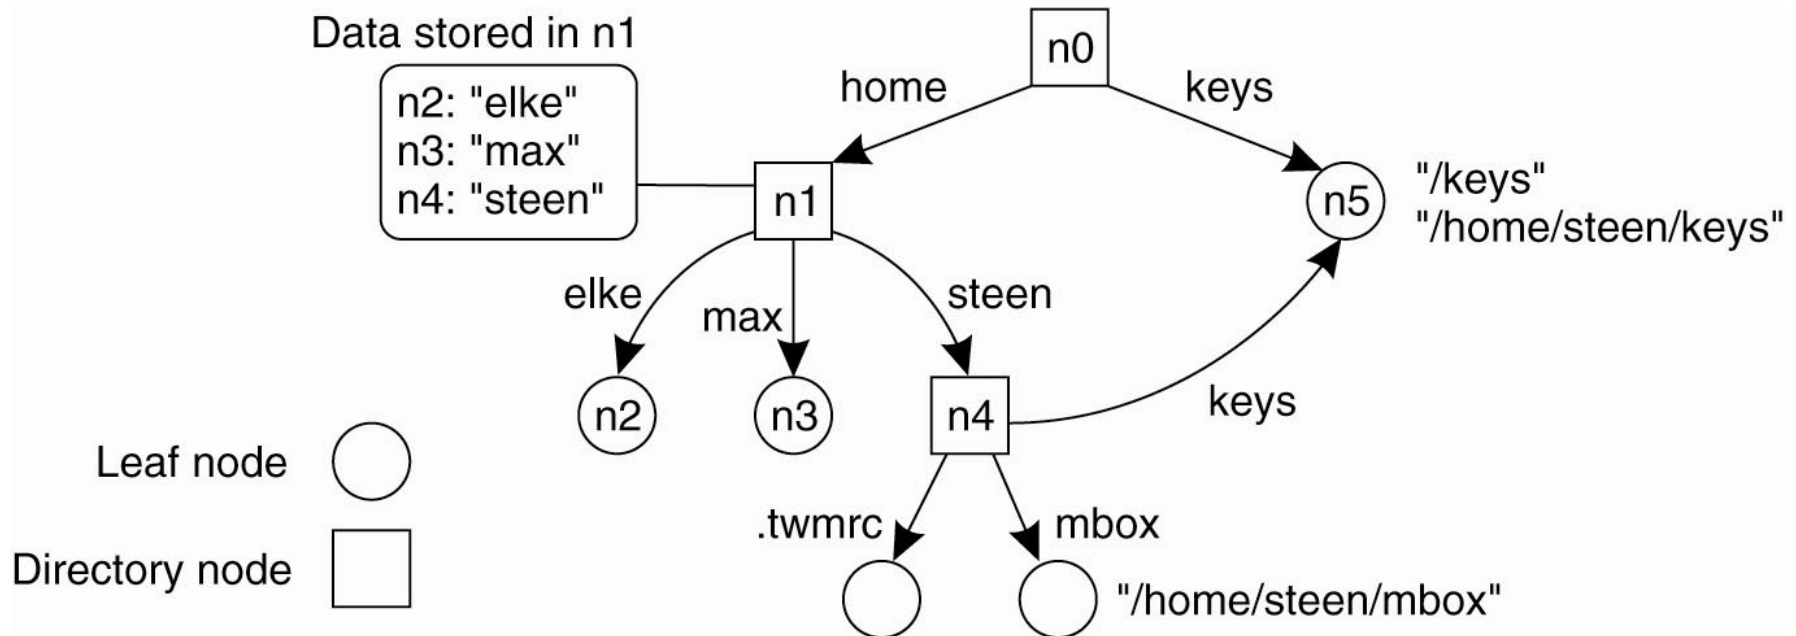

- (a) An insert request is forwarded to the first node that knows about entity E.

# Hierarchical Approaches

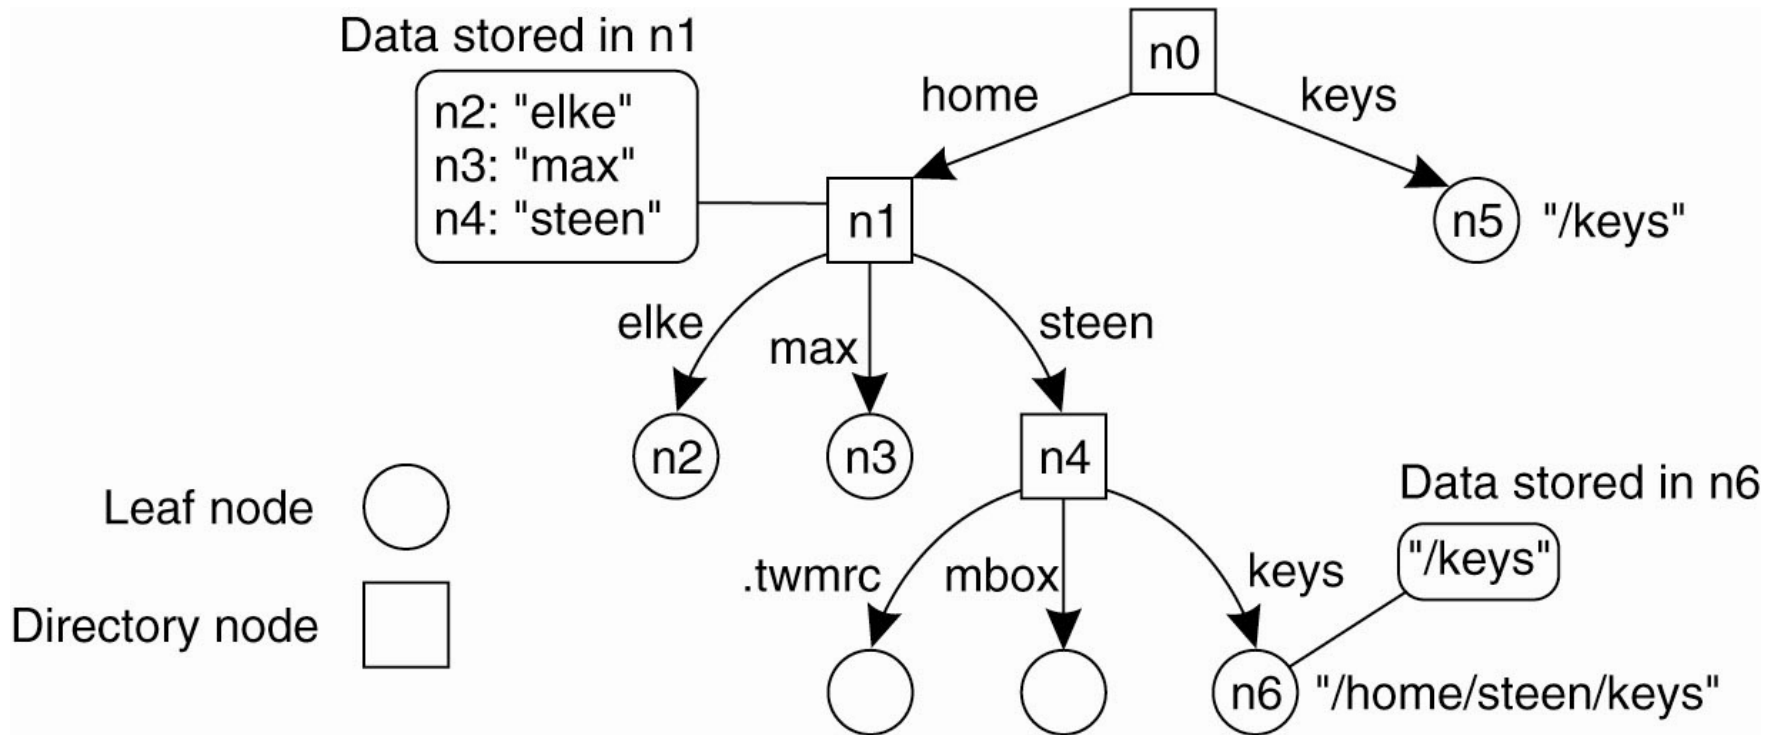

- (b) A chain of forwarding pointers to the leaf node is created.

# Name Spaces

- A general naming graph with a single root node.

# Linking and Mounting (1)

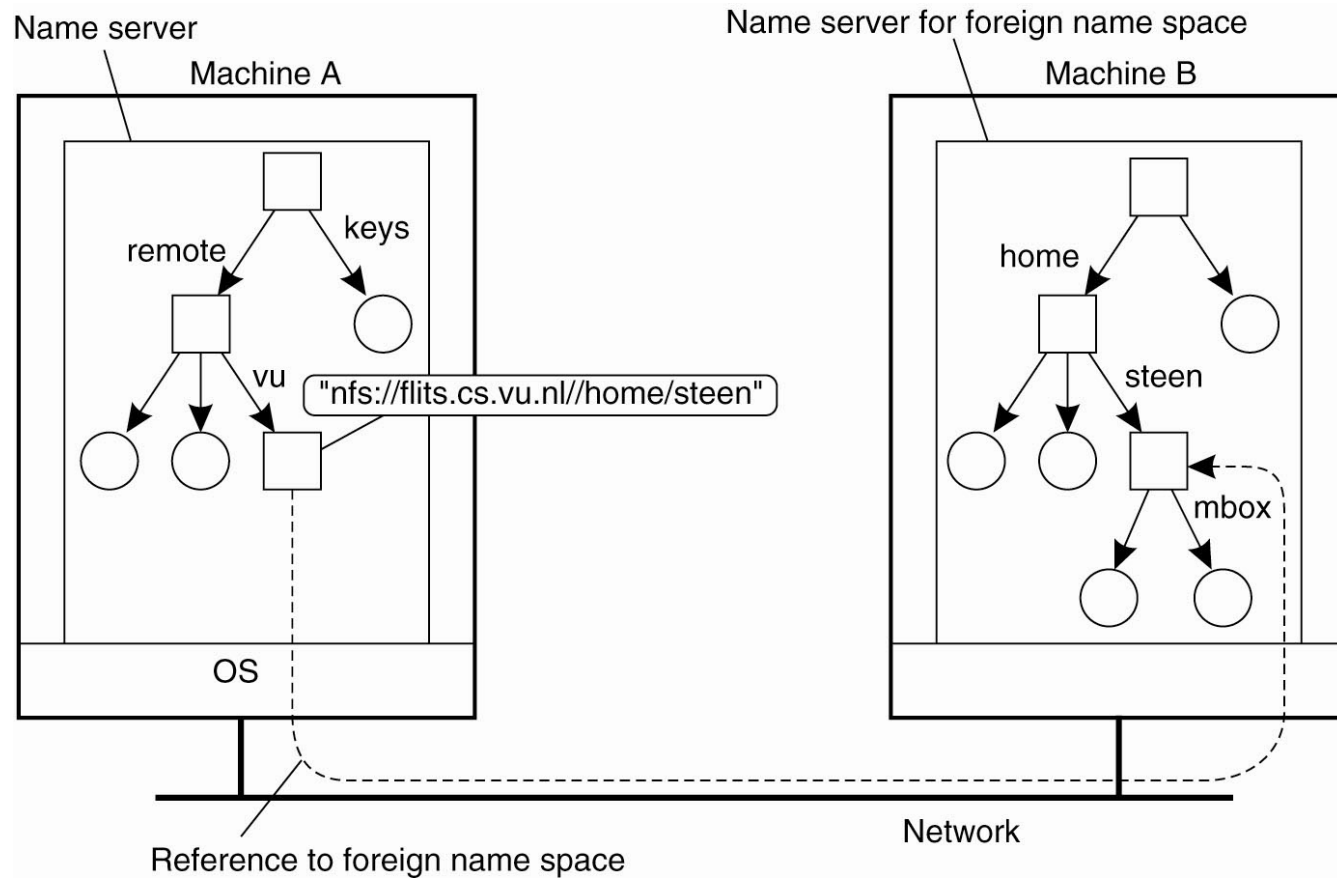

■ Figure 5-11. The concept of a symbolic link explained in a naming graph.

## Linking and Mounting (2)

- Information required to mount a foreign name space in a distributed system
- The name of an access protocol.
- The name of the server.
- The name of the mounting point in the foreign name space.

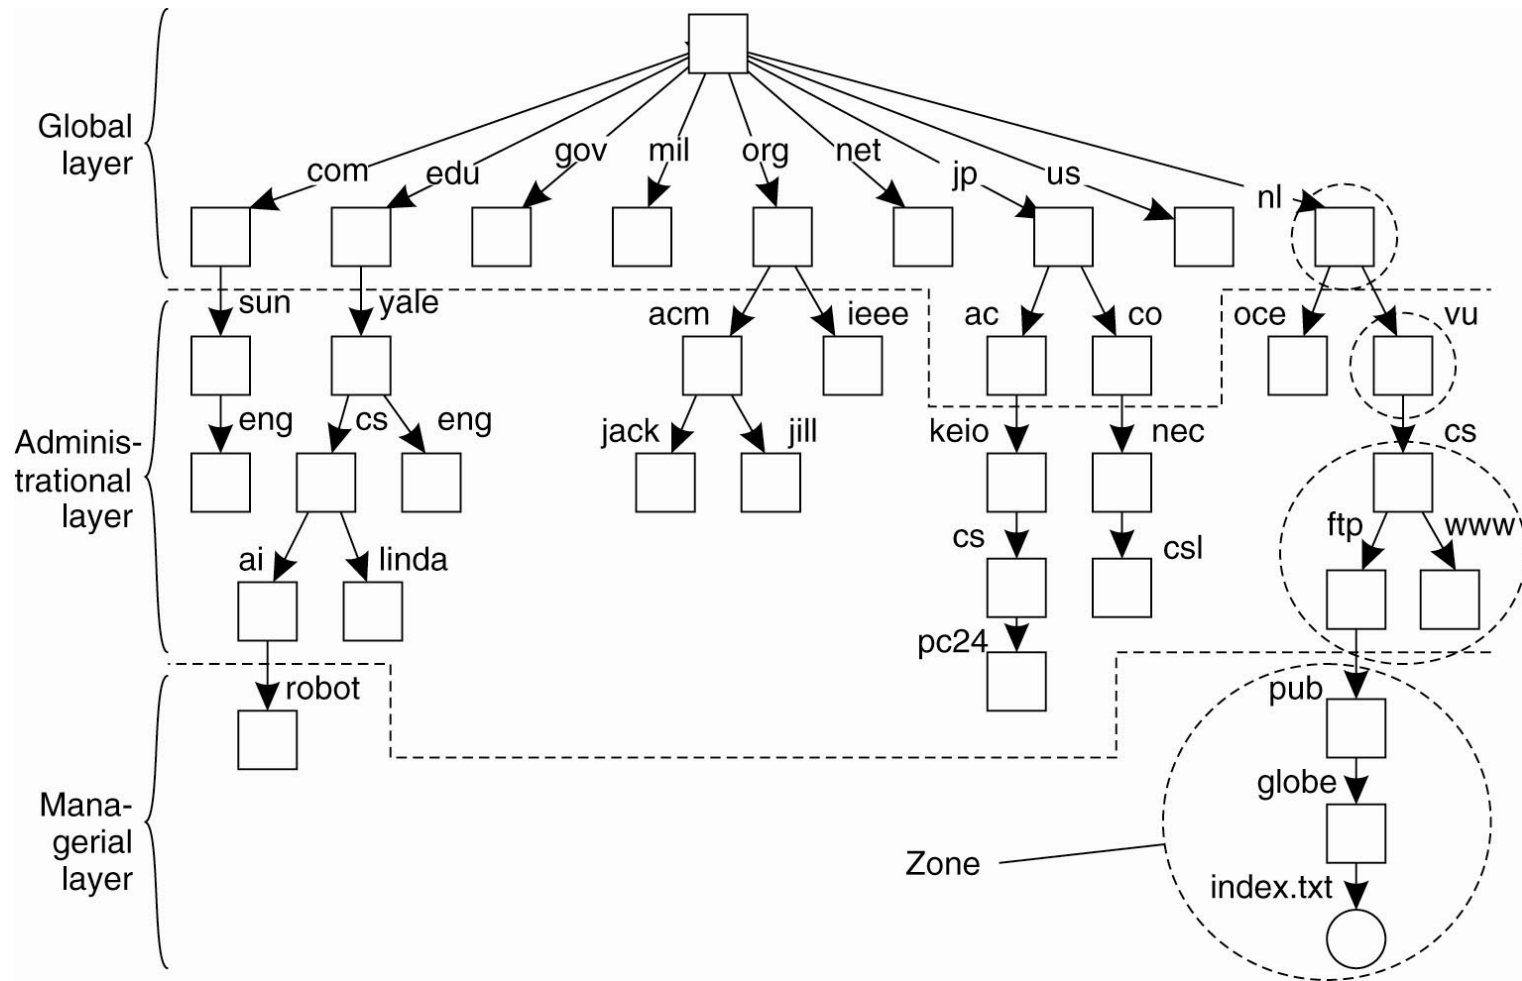

# Linking and Mounting (3)

- Mounting remote name spaces through a specific access protocol.

# Name Space Distribution

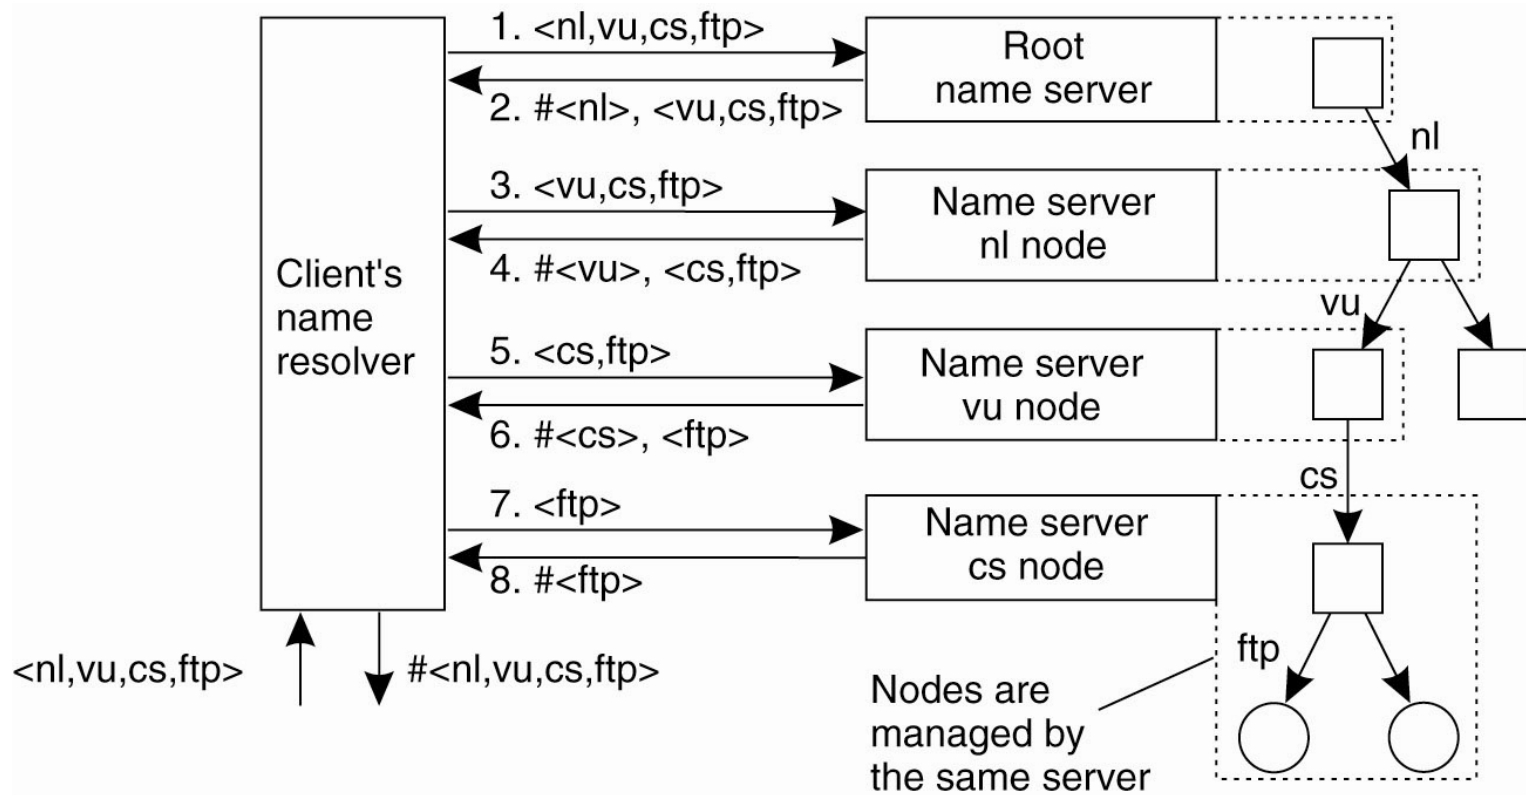

# Name Space Distribution (2)

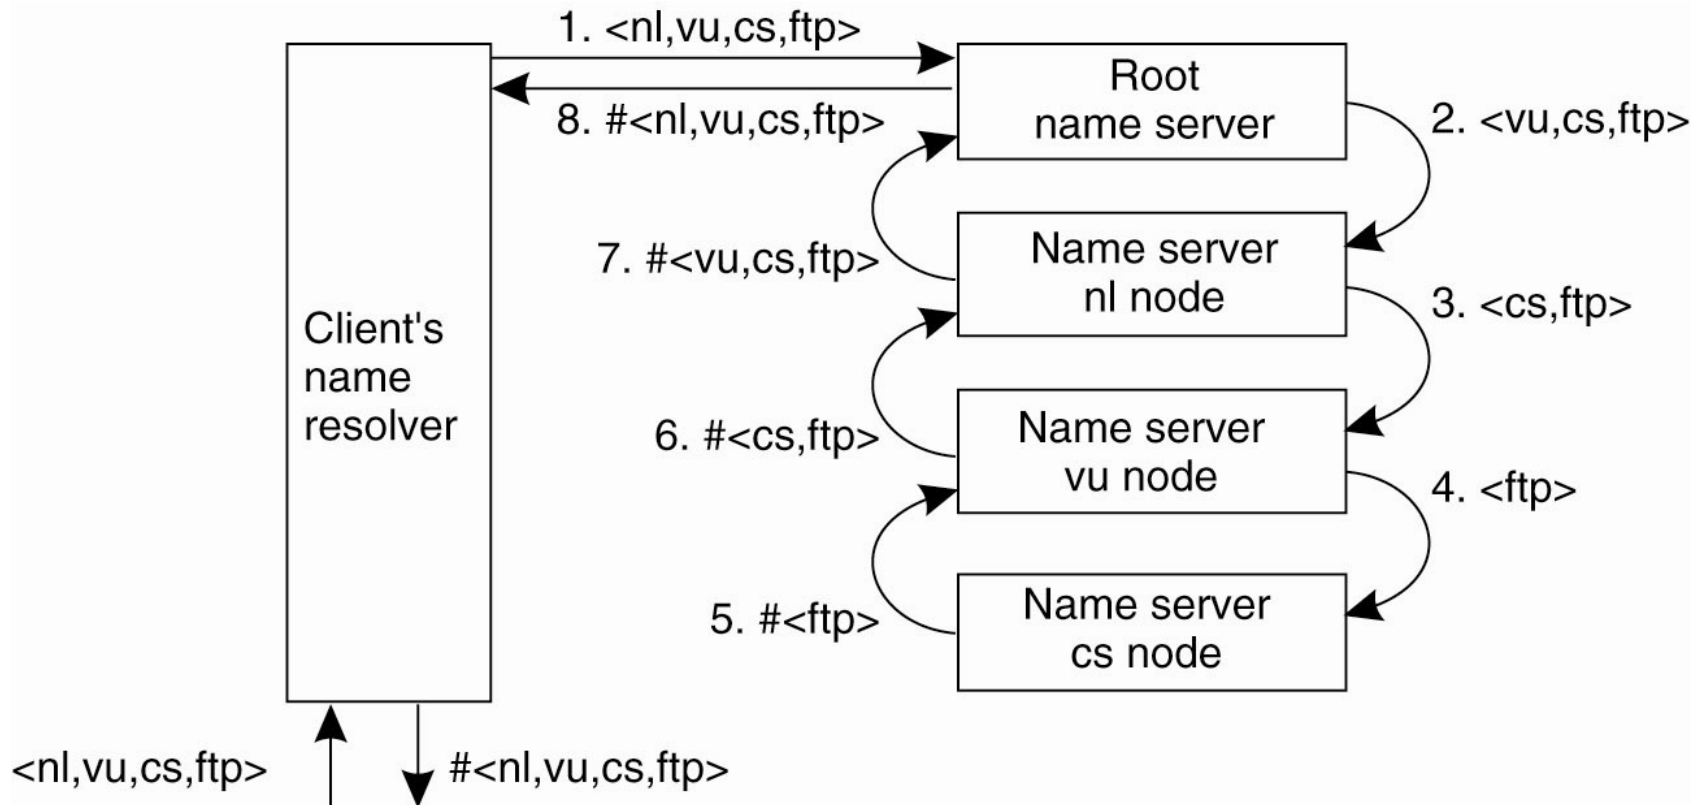

| Item                            | Global    | Administrational | Managerial   |
|---------------------------------|-----------|------------------|--------------|
| Geographical scale of network   | Worldwide | Organization     | Department   |
| Total number of nodes           | Few       | Many             | Vast numbers |
| Responsiveness to lookups       | Seconds   | Milliseconds     | Immediate    |
| Update propagation              | Lazy      | Immediate        | Immediate    |
| Number of replicas              | Many      | None or few      | None         |
| Is client-side caching applied? | Yes       | Yes              | Sometimes    |

- Figure 5-14. A comparison between name servers for implementing nodes from a large-scale name space partitioned into a global layer, an administrative layer, and a managerial layer.

# Iterative name resolution

# Recursive name resolution

# Implementation of Name Resolution (3)

| Server for node | Should resolve | Looks up | Passes to child | Receives and caches               | Returns to requester                                |
|-----------------|----------------|----------|-----------------|-----------------------------------|---|
| cs              | <ftp>          | #<ftp>   | —               | —                                 | #<ftp>  |
| vu              | <cs,ftp>       | #<cs>    | <ftp>           | #<ftp>                            | #<cs><br>#<cs, ftp>                                 |
| nl              | <vu,cs,ftp>    | #<vu>    | <cs,ftp>        | #<cs><br>#<cs,ftp>                | #<vu><br>#<vu,cs><br>#<vu,cs,ftp>                   |
| root            | <nl,vu,cs,ftp> | #<nl>    | <vu,cs,ftp>     | #<vu><br>#<vu,cs><br>#<vu,cs,ftp> | #<nl><br>#<nl,vu><br>#<nl,vu,cs><br>#<nl,vu,cs,ftp> |

- Recursive name resolution of <nl, vu, cs, ftp>. Name servers cache intermediate results for subsequent lookups.

---

# Attribute-based naming

- *(attribute, value)* list
  - Directory services
  - RDF...resource descriptor framework
-

---

# LDAP

- Lightweight directory access protocol

## an LDAP directory entry...

| Attribute          | Abbr. | Value                                  |
|--------------------|-------|--|
| Country            | C     | NL                                     |
| Locality           | L     | Amsterdam                              |
| Organization       | O     | Vrije Universiteit                     |
| OrganizationalUnit | OU    | Comp. Sc.                              |
| CommonName         | CN    | Main server                            |
| Mail_Servers       | —     | 137.37.20.3, 130.37.24.6, 137.37.20.10 |

| WWW_Server         | —     | 130.37.20.20                           |

# Hierarchical Implementations: LDAP

- Part of a directory information tree.

# Hierarchical Implementations: LDAP (3)

| Attribute          | Value              |
|--------------------|--------------------|
| Country            | NL                 |
| Locality           | Amsterdam          |
| Organization       | Vrije Universiteit |
| OrganizationalUnit | Comp. Sc.          |
| CommonName         | Main server        |
| Host_Name          | star               |
| Host_Address       | 192.31.231.42      |

| Attribute          | Value              |
|--------------------|--------------------|
| Country            | NL                 |
| Locality           | Amsterdam          |
| Organization       | Vrije Universiteit |
| OrganizationalUnit | Comp. Sc.          |
| CommonName         | Main server        |
| Host_Name          | zephyr             |
| Host_Address       | 137.37.20.10       |

(b)

- Two directory entries having *Host\_Name* as RDN.

# Mapping to Distributed Hash Tables (1)

```
description {  
  type = book  
  description {  
    author = Tolkien  
    title = LOTR  
  }  
  genre = fantasy  
}
```

(a)

(b)

- (a) A general description of a resource.
- (b) Its representation as an AVTree.

## Mapping to Distributed Hash Tables (2)

```
description {  
  type = book  
  description {  
    author = Tolkien  
    title = *  
  }  
  genre = *  
}
```

(a)

(b)

- (a) The resource description of a query.
- (b) Its representation as an AVTree.
