Mathematical Programming models

$$\begin{aligned} \min(\max) \quad & f(x) \\ \text{s.t.} \quad & g_i(x) = b_i \quad (i = 1 \dots k) \\ & g_i(x) \leq b_i \quad (i = k + 1 \dots k') \\ & g_i(x) \geq b_i \quad (i = k' + 1 \dots m) \\ & x \in \mathbb{R}^n \end{aligned}$$

- $x = \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix}$ is a vector (column) of n **REAL** variables;
- f e g_i are functions $\mathbb{R}^n \rightarrow \mathbb{R}$
- $b_i \in \mathbb{R}$

Linear Programming (LP) models

f e g_i are **linear** functions of x

$$\begin{array}{ll} \min(\max) & c_1x_1 + c_2x_2 + \dots + c_nx_n \\ \text{s.t.} & a_{i1}x_1 + a_{i2}x_2 + \dots + a_{in}x_n = b_i \quad (i = 1 \dots k) \\ & a_{i1}x_1 + a_{i2}x_2 + \dots + a_{in}x_n \leq b_i \quad (i = k + 1 \dots k') \\ & a_{i1}x_1 + a_{i2}x_2 + \dots + a_{in}x_n \geq b_i \quad (i = k' + 1 \dots m) \\ & x_j \in \mathbb{R} \quad (i = 1 \dots n) \end{array}$$

Notice: for the moment, just **CONTINUOUS variables are considered!!!**

We need different methods for models with integer or binary variables.

Resolution of an LP model

- *Feasible solution*: $x \in \mathbb{R}^n$ satisfying all the constraints
- *Feasible region*: set of all the feasible solutions x
- *Optimal solution* x^* [min]: $c^T x^* \leq c^T x, \forall x \in \mathbb{R}^n, x$ feasible.

Solving a LP model is determining if it:

- is unfeasible
- is unlimited
- has a (finite) optimal solution

Solving an LP: example

The farmer problem:
$$\begin{aligned} \max \quad & 6000 x_T + 7000 x_P \\ \text{s.t.} \quad & x_T + x_P \leq 11 & 7 x_T \leq 70 & x_T \geq 0 \\ & 10 x_T + 20 x_P \leq 145 & 3 x_P \leq 18 & x_P \geq 0 \end{aligned}$$

- 2 *incumbent* = $+\infty$
- 3 **repeat**
- 4 generate a combination of m columns of A

Example

LP problem in **standard form**:

$$\begin{array}{llllllll} \min & z = & -13x_1 & - & 10x_2 & & & \\ \text{s.t.} & & 3x_1 & + & 4x_2 & + & s_1 & = & 24 \\ & & x_1 & + & 4x_2 & & + & s_2 & = & 20 \\ & & 3x_1 & + & 2x_2 & & & + & s_3 & = & 18 \\ & & x_1 & , & x_2 & , & s_1 & , & s_2 & , & s_3 & \geq & 0 \end{array}$$

an initial **basic feasible solution** (vertex B):

- $B = \begin{bmatrix} 3 & 4 & 0 \\ 1 & 4 & 0 \\ 3 & 2 & 1 \end{bmatrix} \quad N = \begin{bmatrix} 1 & 0 \\ 0 & 1 \\ 0 & 0 \end{bmatrix}$

- $z_B = c^T x = c_B^T x_B + c_N^T x_N = -71$

Example

Change basis: **New basic solution** \Rightarrow one non-basic variable increases
affecting x_B and z_B

$$\begin{aligned}x_B &= B^{-1}b - B^{-1}N x_N \\z &= c^T x = c_B^T x_B + c_N^T x_N = c_B^T (B^{-1}b - B^{-1}N x_N) + c_N^T x_N \\&= c_B^T B^{-1}b + (c_N^T - c_B^T B^{-1}N) x_N\end{aligned}$$

The (revised) simplex algorithm

- 1 Let $\beta[1], \dots, \beta[m]$ be the column indexes of the **initial basis**
- 2 Let $B = [A_{\beta[1]} | \dots | A_{\beta[m]}]$ and compute B^{-1} e $u^T = c_B^T B^{-1}$
- 3 compute **reduced costs**: $\bar{c}_h = c_h - u^T A_h$ for non-basic variables x_h
- 4 If $\bar{c}_h \geq 0$ for all non-basic variables x_h , **STOP**: B is **optimal**
- 5 Choose any x_h having $\bar{c}_h < 0$
- 6 Compute $\bar{b} = B^{-1}b = [\bar{b}_i]_{i=1}^m$ e $\bar{A}_h = \bar{N}_h = B^{-1}A_h = [\bar{a}_{ih}]_{i=1}^m$
- 7 If $\bar{a}_{ih} \leq 0, \forall i = 1 \dots m$, **STOP**: **unlimited**
- 8 Determine $t = \arg \min_{i=1 \dots m} \{\bar{b}_i / \bar{a}_{ih}, \bar{a}_{ih} > 0\}$
- 9 Change basis: $\beta[t] \leftarrow h$.

Optimal solution

Standard form (the one we solved by simplex method):

$$\bullet x_B^* \begin{bmatrix} x_1 \\ \hat{x}_3 \\ x_6 \end{bmatrix} = B^{-1}b = \begin{bmatrix} 3/5 & -1/5 & 0 \\ -1/5 & 2/5 & 0 \\ -1 & 0 & 1 \end{bmatrix} \begin{bmatrix} 2 \\ 5 \\ 6 \end{bmatrix} = \begin{bmatrix} 1/5 \\ 8/5 \\ 4 \end{bmatrix}$$

$$\bullet x_1^* = 1/5; x_2^* = 0; \hat{x}_3^* = 8/5; x_4^* = 0; x_5^* = 0; x_6^* = 4$$

$$\bullet z_{MIN}^* = c^T x^* = c_B^T x_B^T = \begin{bmatrix} -3 & -3 & 0 \end{bmatrix} \begin{bmatrix} 1/5 \\ 8/5 \\ 4 \end{bmatrix} = -27/5$$

Optimal solution for the initial problem:

$$\bullet x_1^* = 1/5$$

$$\bullet x_2^* = 0$$

$$\bullet x_3^* = -\hat{x}_3^* = -8/5$$

• first constraint satisfied with equality (since $x_4^* = 0$)

• second constraint satisfied with equality (since $x_5^* = 0$)

• third constraint satisfied with a slack of 4 (since $x_6^* = 4$)

$$\bullet z_{MAX}^* = -z_{MIN}^* = 27/5.$$
